

**CLEAN OIL  
BRIGHT IDEAS**

### CJC™ Application Study

**Application Study  
written by:**

Pier Giuseppe Bernini  
K&H Italy

**In cooperation with:**

Mr. Maurizio Zanichelli  
and  
Mr. Cosimo Sorvillo  
IN.CAM. SpA

2009

#### CUSTOMER

**IN.CAM. Fabbrica Barattoli SpA**, a major Italian producer of food cans, caps and easy-to-open lids. Manufacturing plant of Campegine (Reggio Emilia - Italia).

#### THE SYSTEM

Closed loop lubrication system of a press for shell capsule production. Willy Vogel lubrication pump unit.

**Oil type:** EP ISO VG 150

**Oil volume:** 6 L

#### THE PROBLEM

The lubricating pumps are dispensing oil to all the components of the press. The oil is then collected by gravity at the bottom of the press and sent back to the oil tank.

During this cycle, the oil collects dirt and particles very rapidly, leading to frequent oil changes because of the high level of particle contamination.

Contamination was furthermore creating serious problems of excessive wear to the press components.

The engineering department of IN.CAM. was not satisfied with the high maintenance costs and production lost due to unplanned breakdowns.

#### THE SOLUTION

A **CJC™ Fine Filter HDU 15/25 MZ** equipped with 21 L/h pump and **CJC™ Filter Inserts BG 15/25** was installed on the lubrication pump tank (drawing oil from the tank, filtering and sending it back).

#### THE RESULTS

**A few days after the installation, oil contamination codes were reduced to an acceptable level**, allowing an optimal lubrication of components and eliminating the need for oil changes. After four months of operation the ISO level went from an ISO Code 22/20/18 down to 17/16/13.

#### FINANCIAL & ENVIRONMENTAL BENEFITS

The CJC™ Fine Filter reduced costs for new oil and for waste oil disposal, and - more importantly - is now ensuring a constant high level of cleanliness, a fundamental parameter for press reliability.

Since the CJC™ Fine Filter installation, the frequency of unplanned maintenance is drastically reduced, and consequently the engineers have also reduced the planned maintenance frequency.

Savings also include manpower, spare parts and higher machine uptime.

**Thanks to these results, also a second press was upgraded with a CJC™ Fine Filter.**

#### OIL SAMPLE

#### THE RESULT

	BEFORE 28.05.2008	AFTER 17.09.2008
ISO Code	22/20/18	17/16/13
